EDUCATION

University of Washington – Bothell, WA

Master of Science in Computer Science and Software Engineering
Bachelor of Science in Computer Science and Software Engineering

Cumulative GPA: 3.74/4.0
2024 – (Expected) 2027
2020 - 2024

WORK EXPERIENCE

Stoke Space / Boltline

9/25 – Present

Software Engineer - *Kent, WA*

- Led a year long cutover of inventory auditing onto a single activity feed: closed logging gaps from 76% to 100%, backfilled ~1.75 million historical records with an idempotent dedupe Temporal pipeline, shipped who/when/where/what filters across 10+ surfaces, and removed dual writes from the hot path.
- Built an evaluation harness for Claude based matching of historical inventory events to existing activity rows. Iterating prompts against labeled cases until match quality held while cutting token use by 37%.
- Owned automatic percent complete for hardware build tasks. Cut temporal fanout from $O(N)$ to $O(1)$ per work item after instrumenting the bottleneck in Datadog.
- Sole engineer for customer defined inventory flags. Users create custom issue tags and automation rules instead of single hardcoded defect tags, then see those tags on inventory in the build tracker.
- Led 0-1 for manufacturing task scheduling. Turned a vague schedule ask into one model with a DAG and a Gantt, evaluated OSS graph and Gantt libraries vs building in-house, and built the end-to-end implementation.
- Spearheaded and owned the development, deployment, and operation of a coffee chat bot that automatically pairs employees for weekly 1:1s. Scaled adoption to a company wide 500+ users, plus additional sub teams concurrently.

UWB IDEA Lab

3/24 – 1/25

Research Assistant (Lead Full Stack iOS Engineer) - *Bothell, WA*

- Directed the end-to-end design and prototyping of an iOS communication app in Swift for children with speech impediments.
- Conduct user requirement gathering with PMs and Speech Pathologists to design the back-end SQLite database to support personalized communication workflows for various use-cases

OneRadio Corporation

6/23 – 9/24

Software Engineer Intern - *Seattle, WA*

- Led the migration of 3 primary codebases to secure, cloud-based version control on AWS.
- Designed and implemented an LSTM based AI model to predict radio wave behavior.
- Performed and documented black box testing to validate system functionality and support reliable software delivery.

PROJECTS

ClosedSnow | [Demo](#) |

- Built a snow-forecasting web app for four Washington ski resorts, combining live weather, ops status, and avalanche danger in one dashboard.
- Integrated REST APIs (Synoptic, NOAA, OnTheSnow, NWAC) into hourly Github Actions pipeline that calculates freezing level, runs inference on AWS Lambda, and writes results to Postgres.
- Trained a PyTorch snow-water-equivalent model on 28 years of SNOTEL data, then containerized it and deployed it to Lambda to forecast snow at multiple elevations.

IoT Full Stack Water Tank Monitor | [Demo](#) |

- Designed and built an end-to-end IoT system, tracking rainwater levels in outdoor storage tanks to reduce household utility costs.
- Built a scalable AWS pipeline: IoT Core for message ingestion, DynamoDB for storage, and Lambda/API Gateway to expose RESTful endpoints.
- Developed a Flask web app hosted on EC2 for real-time data visualization, with automated threshold-based alerts.

TECHNICAL SKILLS

Coding Languages: C, C++, Java, Python, Bash, Swift, SQL, JavaScript, TypeScript, HTML, Motorola 68000 Assembly, ARM Assembly, Cuda, MATLAB, LaTeX.

Tools: AWS (EC2, S3, EBS, ECS, RDS, DynamoDB, Lambda, IoT Core, API Gateway, Fargate, IAM, Cognito, Session Manager, Secrets Manager), Azure (App Services, Function App, Storage Accounts, Virtual Machines, Stream Analytics Jobs, Cosmos DB, SQL Databases), DataDog, Git, Docker, RESTful APIs, MySQL, PostgreSQL, Vercel, Supabase, Qualtrics, Figma, Visual Studio Code, ArcGIS Pro.

Libraries: Temporal, TensorFlow, PyTorch, Keras, Pandas, NumPy, sklearn, NLTK, Seaborn, Requests, Svelte, Flask, React, Node.js, Next.js, CSS, Bootstrap.
